Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. The journal publishes over 4000 structures per year. The average publication time is less than one month.

Received 17 December 2012; accepted 8 January 2013

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{Mo}-\mathrm{O})=0.001 \AA$; disorder in main residue; $R$ factor $=0.016 ; w R$ factor $=0.032$; data-to-parameter ratio $=16.2$.

In scheelite-type $\mathrm{La}_{0.667}\left[\mathrm{MoO}_{4}\right]$, one crystallographically unique position with site symmetry $\overline{4}$. and an occupancy of $2 / 3$ is found for the $\mathrm{La}^{3+}$ cation. The cation is surrounded by eight O atoms in the shape of a trigonal dodecahedron. The structure also contains one $\left[\mathrm{MoO}_{4}\right]^{2-}$ anion (site symmetry $\overline{4} .$.$) , which is surrounded by eight vertex-attached \mathrm{La}^{3+}$ cations. The polyhedra around the $\mathrm{La}^{3+}$ cations are interconnected via common edges, building up a three-dimensional network, in the tetrahedral voids of which the $\mathrm{Mo}^{6+}$ cations reside.

## The defect scheelite-type lanthanum(III) ortho-oxidomolybdate(VI) $\mathbf{L a}_{0.667}\left[\mathrm{MoO}_{4}\right]$

Tanja Schustereit, Thomas Schleid and Ingo Hartenbach

## Comment

The title compound crystallizes isotypically with the already known defect scheelite-type lanthanide orthooxidomolybdates(VI) with general formula $L n_{0.667}\left[\mathrm{MoO}_{4}\right](L n=\mathrm{Ce}, \mathrm{Pr}, \mathrm{Nd}$, and Sm ; Schustereit et al., 2011). The crystallographically unique $\mathrm{La}^{3+}$ cation at Wyckoff position $4 b$ is surrounded by eight oxide anions in the shape of a trigonal dodecahedron (Fig. 1). Besides the lanthanum cation, the structure also contains an isolated and bisphenoidally distorted tetrahedral ortho-oxidomolybdate(VI) unit $\left[\mathrm{MoO}_{4}\right]^{2-}$. Its central $\mathrm{Mo}^{6+}$ cation at Wyckoff position $4 a$ exhibits the same site symmetry ( $\overline{4} .$.$) as the \mathrm{La}^{3+}$ cation. Hence, in order to maintain electroneutrality, the latter shows a statistically under-occupation of $2 / 3$ on its atomic position. The $\left[\mathrm{MoO}_{4}\right]^{2-}$ tetrahedra share common vertices with eight $\left[\mathrm{LaO}_{8}\right]^{13-}$ dodecahedra to build up the scheelite-type crystal structure (Fig. 2). The cations at the sites $4 a\left(\mathrm{La}^{3+}\right)$ and $4 b\left(\mathrm{Mo}^{6+}\right)$ are thereby arranged in two interpenetrating diamond-like lattices (Schustereit et al., 2011).

## Experimental

Colourless, irregular-shaped single crystals of scheelite-type $\mathrm{La}_{0.667}\left[\mathrm{MoO}_{4}\right]$ were obtained as a by-product in an unsuccessful attempt to synthesize $\mathrm{LaF}\left[\mathrm{MoO}_{4}\right]$ according to the Pecchini method (Liu et al., 2012). Aqueous solutions with stoichiometric amounts of $\mathrm{La}\left(\mathrm{NO}_{3}\right)_{3}$ and $\left(\mathrm{NH}_{4}\right)_{6} \mathrm{Mo}_{7} \mathrm{O}_{24}$ (molar ratio 7:1) were prepared for each compound and HF was added to the latter (molar ratio $\left.\mathrm{HF}:\left(\mathrm{NH}_{4}\right)_{6} \mathrm{Mo}_{7} \mathrm{O}_{24}=7: 1\right)$. As chelating agent, citric acid (CA) was dissolved in both solutions with a molar ratio of $\mathrm{CA}: \mathrm{La}^{3+}=1: 1$ and $\mathrm{CA}: \mathrm{Mo}^{6+}=2: 1$. The pH value of the $\mathrm{La}^{3+}$-containing solution was adjusted to $3-4$ with an aqueous ammonia solution as well as the pH value of the $\mathrm{CA} / \mathrm{HF} /\left(\mathrm{NH}_{4}\right)_{6} \mathrm{Mo}_{7} \mathrm{O}_{24}$ mixture, in this case to a value of $7-8$. The two solutions were combined, stirred, and heated for about 30 minutes to obtain a transparent solution, which was then dried at 473 K for 5 hours. The residual product was thermally treated in air at 1123 K for 12 hours.

## Refinement

The site occupation factor of the $\mathrm{La}^{3+}$ site was refined freely to a value of 0.6676 (10).

## Computing details

Data collection: COLLECT (Nonius, 1998); cell refinement: SCALEPACK (Otwinowski \& Minor, 1997); data reduction: SCALEPACK and DENZO (Otwinowski \& Minor, 1997); program(s) used to solve structure: SHELXS97 (Sheldrick, 2008); program(s) used to refine structure: SHELXL97 (Sheldrick, 2008); molecular graphics: DIAMOND (Brandenburg, 2006); software used to prepare material for publication: SHELXL97 (Sheldrick, 2008).

Figure 1
Trigonal dodecahedral oxygen environment of the $\mathrm{La}^{3+}$ cation in defect scheelite-type $\mathrm{La}_{0.667}\left[\mathrm{MoO}_{4}\right]$; ellipsoids are drawn at the $80 \%$ probability level. [Symmetry codes: (i) $x, y, z$; (ii) $-x+1 / 2,-y, z+1 / 2$; (iii) $-y+3 / 4, x+1 / 4, z+1 / 4$; (iv) $y+3 / 4$, $x+3 / 4, z+3 / 4$; (v) $-x,-y,-z$; (vi) $x+1 / 2, y,-z+1 / 2$; (vii) $y+1 / 4,-x+3 / 4,-z+3 / 4$; (viii) $-y+1 / 4, x+1 / 4,-z+1 / 4]$.

Figure 2
View of the crystal structure of defect scheelite-type $\mathrm{La}_{0.66}\left[\mathrm{MoO}_{4}\right]$ along [010]; the bisphenoidally distorted tetrahedral ortho-oxidomolybdate(VI) units $\left[\mathrm{MoO}_{4}\right]^{2-}$ are given in the polyhedral representation.

$\Delta \rho_{\text {min }}=-0.37$ e $\AA^{-3}$
Extinction correction: SHELXL97 (Sheldrick, 2008), $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$

Extinction coefficient: 0.0082 (5)

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors (gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
